

Establishing Communication to botnet using stupid Discord

This is a design dedicated to establish connections between a botnet or any other type of malware thru discord bot and discord server. Using Discord API it helps the malicious software to bypass antiviruses and firewalls because it appears as a typical normal discord connection.

The Discord API uses https, and Discord also provides a dedicated server for typical users for communicating, but with this architecture we can exploit what Discord provides to act as a Command and Control Server for our malicious program.

Unlike any other design this one has a unique property:

An attacker can set up a private discord server and create two discord bots using a disposable account while over Tor and VPN.

One bot is the **Receiver** and one is the **Sender**. Only these two discord bots will remain in the server. The server will then enter a state called Limbo.

Receiver:

This Discord bot is the key for the infected devices to connect to the private server since the software establishes a connection to this bot using its Token key.

This bot is programmed to actively listen for commands and sends it to the malicious software in the infected machine.

Sender:

This Bot is controlled by the attacker behind an custom command line interface, this bot acts as a middle man between the attacker and the receiver.

Using a bot rather than the disposable account to communicate with the receiver is better even when Discord keeps permanent internal records of who made the server, It can be avoided to use the same account to accidentally break Opsec.

Whatever the attacker types in the command line interface hidden behind Tor and VPN will be sent by the bot in the server and will be read by the ending receiver.

It's now up to the malware author to enhance the evasion ability of the malware and to also provide features for the botnet.
